

fish4ever.org

Industrial fishing is destroying entire ecosystems, killing marine wildlife, and rapidly wiping out the world's fish stocks. Less than 1% of the world's oceans are marine protected areas.

fish4ever.org is a global internet campaign calling for a halt to overfishing and the creation of a network of marine parks to safeguard the future of our oceans.

fish4ever.org

Overfishing is out of control. Soon, many fish populations may become extinct. Large numbers of whales, dolphins, sharks, rays, marine mammals and seabirds are also being killed as accidental 'by-catch' and ocean habitats ranging from coral reefs to deep-water sea mounts are under threat.

fish4ever.org is calling for the urgent implementation of sustainable fisheries and the creation of more marine protected areas. We will work with existing marine conservation groups and concerned scientists to highlight crucial issues and, through mass email campaigns, call for change through national governments and international forums such as the EU and the UN.
